

Statement of Project Contribution

This project was a complete group effort, and we didn't really split the parts up. Instead, all three of us Pratham Galbale, Kritarth Gusain and Yuvraj Singh Shehrawat worked on everything together. For the research part, we all sat down and read the WinCLIP and AnomalyGPT papers to figure out how they worked. We actually wanted to do AnomalyGPT at first, but after we checked the requirements, we realized our laptops and GPUs couldn't handle the heavy LLM training it needed. So, we all decided to focus on WinCLIP and see how we could make it better.

When it came to coding, we didn't have separate files for each person. We worked on one shared codebase where everyone added stuff. We all helped write the WinCLIP part, fixed the windowing logic, and worked together to come up with the OpenCV code that calculates the blur and lighting (the alpha values). For the experiments, we all took turns running the code on the different datasets like MVTec and the Casting images to see if our changes actually helped the score. Throughout the project, all members provided review for each other's work, ensuring that the code was debugged, the data was validated, and the final submission adhered strictly to the CS F425 guidelines.
